Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents a human ICR-1.1 V-K region amplified PCR product. This sequence is used in the isolation of a novel human product. This sequence is used in the isolation of a novel human in the recellular adhesion molecule, ICAM-R. This sequence is used in a method which investigates modulators of the interaction between ICAM-R and the 14.3.3 family member H31-beta and tubulin. An anti-ICAM-R antibody optionally coupled to toxin or radionuclide, or an ICAM-R perticularly its effector functions involved in (non) specific immune responses. ICAM-R related agents may be used to treat or monitor inflammation, disorders involving T cell activation or macrophages, e.g. adult respiratory distress syndrome, stroke, Crohn's disease, multiple sclerosis, rheumatoid arthritis, asthma, tumour growth, human immune deficiency virus infection, diabetes, graft vs. host disease and anny others. Antibodies may also be used for passive immunisation, ic rumbre syntessing cells. ICAM-R and for identifying ICAM-R expressing cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DIOMIQSPASLSASVGDRVTITC-----WYLOKPGKSPO-LIY-----GVPSR 42

                                                                                                                                                                                                                                                                                                                                                                                                                                    treating allergy, septic or endotoxic shock, septicaemia, stroke, asthma, graft versus host disease, Crohn's disease, or inflammatory bowel disease. This sequence represents a protein associated with the humanised murine Mu007 antibody described in the disclosure of the
                                                                                                                                                                                                                         This invention describes a novel antibody that specifically binds mature human interleukin (IL) lbeta, and binds the same epitope on mature human IL-lbeta as mouse monoclonal antibody Mu007 or humanized antibody Hu007. The antibody of the invention have antirhewmatic, antiarchritic, antiaflammatory, osteopathic, antiallergic, cerebroprotective, antiasthmatic, immunosuppressive and antibacterial activity and can be used in a vaccine. The antibody is useful for manufacturing a medicament for treating rheumatoid arthritis or osteoarthritis, or for inhibiting cartilage destruction in a subject. The antibody is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 DIQMIQSPSSLSASVGDRVTITCWFQQKPGKAPKSLIYGVPSRFSGSGSGTDFTLTISSL 60

This sequence represents an antibody specific for ICAM-R.

The invention relates to antibodies (AD) which bind specifically

The invention relates to antibodies (AD) which bind specifically

to the interaction between ICAM-R and alpha d/CDI8. Abs with specific ICAM-R

interaction between ICAM-R and alpha d/CDI8. Abs with specific ICAM-R

binding are useful in compositions for immunisation, and for purifying

ICAM-R polypeptides and identifying cells expressing ICAM-R on their cell

involving ICAM-R, especially inflammatory responses of the specific

immune system, the non-specific immune system, monitoring and treating

immune system, the non-specific immune system, monitoring and treating

infection. In particular diseases involving an essential T cell

activation (e.g. asthma, psoriasis, diabetes, graft vs. host disease,

tissue transplant rejection, and multiple sclerosis) may be treated with

anti-ICAM-R antibodies. The Abs specifically bind to and identify ICAM-R

and disrupt ICAM-R to cell adhesion molecule, especially alpha d/CD18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DIĞMTÖSPSSLSASVGDRVTITCSASSSVSYIYMYQQKPGKAPKLIYLTSNLASGVPSR 64

                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the humanised light chain of murine antibody ICR-1.1. This antibody is specific for ICAM-3 (intercellular adhesion molecule-R). ICAMs are polypeptides that are expressed on blood vessel endothelial cell surfaces and are involved in the adhesion events in various conditions. ICAM-8 variants (see AAW71264-69) can be used to treat or monitor inflammatory conditions involving specific on be used to trospecific immune responses, asthma, tumour growth and/or metastasis and viral infections. The ICAM variants are produced recombinantly, from expression libraries of mutated sequences, and the ones that are adhesion events. They can also be used to raise antibodies, also for use as therapeutic or diagnostic agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-human immunodeficiency virus, HIV, cytostatic, ICAM-R, ARDS; stroke, intercellular adhesion molecule, immunoglobulin heavy chain; septicaemia, inflammatory conditions; glomerulonephritis, arthritis, dermatosis; haemodialysis; leukapherseis, ulcerative colitis; Crohn's disease; necrotising enterocolitis; atherosclerosis; psoriasis, asthma; transplant rejection; diabetes; tumour.
                                                                                                                                                                                                                                                                     The invention relates to humanised ICR-1.1 and ICR-8.1 antibodies targeted to the human intercellular adhesion molecule polypeptide (ICAM-R) polypeptide. Antibodies specific for ICAM's are potentially useful as therapeutic compounds, for treating e.g. immune-mediated inflammatory conditions (e.g. graft-versus-host disease), aschma, tumours or viral infections. Monoclonal antibodies specific for ICAM-R, or their conjugates formed with e.g. toxins or radionuclides are useful for therapeutically targeting or detecting neovascularisation sites. The present sequence tepresents the amino acid sequence of the Vk region of the humanised antibody ICR-1.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 DIOMIOSPASISASVGDRVTITC-----WYLQKPGKSPQ-LIY------GVPSR 42

This invention relates to a hybrid fusion protein comprising an intercellular adhesion molecule (ICAM-R) amino acid fragment at its amino terminus and a constant domain of an immunoglobulin heavy chain at its carboxy terminus. ICAM-R polypeptides are useful for treating and monitoring inflammatory conditions such as adult respiratory distress syndrome, multiple organ injury syndrome secondary to septicacemia or cranma, reperfusion injury of tissue, acute glomerulonephitis, reactive arthritis, dermatosis, stroke, thermal injury, haemodialysis, enterocolitis, granulocyte transfews, acute glomerulorephitis, reactive also useful for treating conditions response of the also useful for treating conditions respectively. ICAM-R polypeptides are also useful for treating conditions repetiding from a response of the specific immune system in a mammal e.g. postasis, organ/tissue arthritis, diabetes and lupus erythematosus. ICAM-R products and ICAM-R cransplant rejection and autoimmune diseases including Raymand's syndrome, autoimmune thyroiditis, multiple solerosis, rheumatoid cransplant and or metastasis and viral infection (e.g. HIV infection). Sequences AAA97090 and AAB13036 represent the human ICAM-R DNA sequences AAA97090 and AAB13036 represent the human ICAM-R antibody ICR-8.1, and fragments of the humanised anti-ICAM-R antibody. Sequences AAA97112-A97123 and AAA97132-A97132 represent cransplant approacher metastasis and probes, all used in the production of mannised anti-ICAM-R antibody. Sequences AAA97135-A97156 and AAA97132-A97136 represent murine (ICC ICR-1) sequences AAA97155-A97156 represent primers used in the production of continual and peptide sequences used in the humanised anti-ICAM-R antibody ICR-8.1, and including AAA97132-A97136 and AAB97133-A997156 and AAB97131-A997132 represent murine (ICC ICR-1) sequences DNA and peptide sequences used in the production of the chimaric protein of the invention include AAA971717-A97188 and chimaric protein of the invention include sequences used in the production of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4

The present invention describes a monoclonal antibody (WAb) (I),

produced by the hybridoma cell line 81K2F (ATCC HB 11692). Also described

are: (1) a hybridoma cell line 81K2F; and (2) a MAb (II), that competes

with (1) for binding to ICAM-R (intracellular adhesion molecule

creeptor) (III). (II) mimics the activity of natural binding proteins

through which intercellular and intracellular activities of (III) are

modulated. (II) is also used for modulating the immune responsee. (I) is

useful in modulating the ligand/receptor binding biological activity

involving (III) especially those effector functions of (III) involved in

specific and non-specific immune system responsee. Inflammatory

conditions which may be treated or monitored with related products of

(III) include conditions resulting from a response of the non-specific

immune system in a mammal e.g. adult respiratory distress syndrome,

creparfusion injury of issue, acute glomerulonephritis, reactive

arthritis, stroke, ulcrative colitis and atherosclarosis, and conditions

resulting from a response of the specific immune system in a mammal, e.g.

specials, organ/tissue transplantation rejectorion, autofmunne diseases

cuch as autoimmune thyroiditis multiple sclerosis, rheumatoid arthritis,

diabetes and lupus erythematosue, and the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for identifying a compound that modulates phosphorylation of human intercellular adhesion molecule polypeptide (ICAM-R) by protein kinase C isoform. The method comprises: (a) exposing a purified peptide consisting of the cytoplasmic domain of ICAM-R to protein kinase C isoform and labeled adenosine triphosphate in the presence and absence of a test compound; (b) measuring labeled thosphosphate transferred to the peptide; and (c) identifying a test compound that affects transfer of the labeled phosphate as a modulator compound. The method is useful for identifying compounds that modulate the phosphorylation of human intercellular adhesion molecule polypeptide which might form the basis for the development of therapeutic and diagnostic agents. This sequence represents the humanised murine ICR-1.1 antibody VK region which is used in the method of the invention.

transplant rejection, autoimmune diseases including Raynaud's syndrome, autoimmune thyroiditis, multiple sclerosis, rheumatoid arthritis, lugus erythematosus, asthma, tumnour growth and/or metastasis, viral infection, tissue transplant rejection, graft versus host disease and multiple sclerosis. (II) is also useful for immunisation, for purifying ICAM-R polypeptides and for identifying cells that display the polypeptides on their surfaces. AAUF0928-AAUF0946 represent ICAM amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a gene recombinant antibody that has specific reaction with human vascular endothelial growth factor (VEGF) receptor Pit-1. The antibodies are useful for diagnosis and as remedies for diseases due to abnormal neovascularisation such as proliferation or metastasis of solid tumor, arthritis in rheumatoid arthritis, diabetic
                                                                                                                                                                                                                                                                                                                                                                                 DIOMIOSPSSLSASVGDRVIITCSASSSVSYIYWYQQRPGRAPKLLIYLTSNLASGVPSR

(I) is useful for producing an intercellular adhesion molecule (TCAM) monoclonal antibody (II). (II) is useful for treating inflammatory conditions including adult respiratory distress syndrome, multiple organ injury syndrome secondary to septitoemia or trauma, tissue repertuaion injury, acute glomerulonephisis, reactive arthritis, dermatcosis with acute inflammatory components, stroke, thermal injury, haemodialysis, leukopheressis, ulcerative collis, crohn's disease, necrotishing entercoclisis, granulocyte transfusion associated syndrome, diabetes, atherosclerosis, cytokine-induced toxicity, psoriasis, organ/tissue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a reagent for detecting differentiation of monocytes and macrophages from haematopoietic stem cells, containing a substance which binds to human vascular endothelial growth factor (WEGF) receptor Fit-1. The invention also includes a method for diagnosing a disease in which the differentiation of monocytes and macrophages is limplicated, using the reagent, and an agent for the treament of diseases diagnosed using the method, containing a substance which binds to Fit-1 or a substance which inhibits the signal transduction of Fit-1. Diseases which may be diagnosed or treated include inflammation, delayed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   hypersensitivity, malignant tumours and arteriosclerosis.

AAF70190 - AAF70244, AAF70251 and AAF70258 represent DNA sequences encoding anti-human Fit-1 monoclonal antibody fragments and oligomuclectides used in the construction of the antibody. The monoclonal antibody is used in the reagent of the invention. FCR primers AAF70245 - AAF78870 (excluding AAF70251) are used in the isolation of the antibody DNA sequences. Protein sequences AAB78848 - AAB78870 represent fragments of the anti-human Fit-1 antibody.

The 431/26 VH and VK antibody fragments represented in AAQ26757-58 are pref. for the prodn. of the fuelon proteins of formula huruwAk.L-beta-dluc (1) (huruwAk= humanised, tumour-specific monoclonal antibody, or its tumour-binding fragments); L= linker; beta-dluc= human beta-glucuronidase). BetaGlc Linker 1 and betaGlc Linker 2 oligonucleotides are given in AAQ26759-60. Hinge 1 and hinge 2b oligonucleotides are given in AAQ26761-62.

(1) are used to activate prodrugs. The antibody component provides for specific targetting to tumours while the beta-dluc component activates a suitable prodrug by cleavage of glucuronic acid. The combination of the prodrug and (1) is useful in tumour treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 DIOMIOSPASISASVGDRVIIIC------WYLOKPGKSPQ-LIY-----GVPSR

The first strand cDNA was used as a template for PCR to obtain double stranded DNA fragments encoding the variable regions of both the heavy and light chains of monoclonal antibody 23F2G. The sequence shown is a humanised form of the light chain variable region of MAD 23F2G. The humanised form of MAD 23F2G may be administered to alseviate symptoms associated with inflammatory disease states, espicot the inhibition of inflammatory processes associated with multiple sclerosis. The MAD blocks leukocyte adhesion and
                                                                                                                                                                                                                                                                                                                                                                           Amplification, 23F2G; humanised antibody; heavy chain; light chain; hybridoma; inflammation, CD18; human leukocyte integrins; mAb 60.3; monoclonal antibody; LFA-1; adhesion; migration; multiple sclerosis; MS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                migration to inflammatory sites. The MAb is an anti-CD18 integrin antibody which competes with MAb 60.3 for binding to LFA-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antibodies immunologically reactive with the CD18 of human leukocyte integrins and/or competing with mAb 60.3 for binding to human LFA-1 - for alleviating symptoms associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 80.5%; Score 335; DB 15; Length 111;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes the hybridoma cell line 23F2G (ATCC HB 11801) and the Chinese hamster ovary (CHO) cell lines 656 (ATCC CRL 11398) and B13-24 (ATCC CRL 11397). Monoclonal antibody (MAD) 23F2G (and its humanised variants 666 and B13-24) is an anti-human CD18 antibody for the treatment of inflammation, specifically multiple sclerosis. The present sequence represents humanised 23F2G light chain variable region from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 bigwigspsslsasvedrytitcrasesvesygnnemywygokegkapkiliylasnies
                                                                                                                                                                                 Mouse; humanised; antibody; heavy chain variable region; light chain; 23F2G; inflammatory disease; multiple sclerosis; common beta chain; CD18; human leukocyte integrin.

fragment/enzyme fusion proteins can be used for tumour therapy, fragment/enzyme fusion proteins can be used for tumour therapy, c especially when the fusion protein comprises a tumour-specific especially when the fusion protein comprises a unon-toxic prodrug to a toxic drug. The fusion proteins are constructed in expression vectors and expressed in thioredoxinreductase deficient B.coli, allowing expression products to be isolated in soluble functional form without renaturation. The Ab fragment is an FAb fragment or an antigen binding region. In the fusion protein, the Ab component is humanised and the enzyme component is a human cytoplasmic enzyme. This fusion protein comprises the antibody constant and variable light chain regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prodn. of recombinant antibody (Ab), Ab fragment or Ab/enzyme fusion protein - by cytoplasmic expression in thio:redoxin:reductase deficient E. coli

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    986,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 The sequence represents residues from a human immunoglobulin with homology to the heavy chain variable region from monoclonal antibody compounded by a mouse hybridoma. The sequence is partial, and produced by a mouse hybridoma. The sequence is partial, and complementarity determining regions are omitted. The sequence is isolated by comparison of human and mouse immunoglobulins and analysis for T-lymphocyte antigent sequences using a computer calgorithm. Residues not within a complementarity determining region, canonical structure or Vernier zone may be modified to reduce immunogenicity in humans (e.g. in sequence AAR929292). This method, which involves the introduction of only a few point mutations into T-cell epitope coding regions, is generally applicable in humanisation of mouse antibodies. The resulting humanised antibodies may be used e.g. as antitumour agents. They retain the antipen recognition of the original antibody, but are not immunogenic in humans. Cupianal antibody, but are not immunogenic in humans.

 Hepatitis B virus (HBV) is responsible for hepatitis infection in humans, which may progress to liver cirrhosis or cancer. One of HBV's surface antigens is pre-Si. Monoclonal antibodies specific for pre-Si antigen may efficiently neutralise HBV. The present invention relates to humanised antibodies specific for HBV surface antigen pre-Si. The humanised antibodies are useful for preventing HBV infection and for treating chronic hepatitis B. The Complementarity Determining Regions of mouse pre-Si antibody KR127 were grafted onto human antibody to produce the humanised antibodies of the present invention. The present sequence is the humanised pre-Si antibody HKR127HC(I) heavy chain variable region (VH). The coding sequence for the present sequence was produced from the coding sequence of the mouse pre-Si antibody VH sequence (AAA62115).

 The present sequence represents the heavy chain variable region of the humanised murine antibody 3D1. The antibody has a binding specificity to B7 molecules. The antibody is used to construct humanised immunoglobulins, which comprise an antigen binding region of non-human origin and a portion of a human immunoglobulin. The humanized diseases, inflammatory derived for treating autoimmune diseases, infectious diseases, inflammatory dermatitis, systemic lupus erythemacosus, diabetes mellitus, insultis, asthma, arthritis, inflammatory benefits, and multiple sclerosis. The immunoglobulins are also useful for treating a transplant recipient or preventing transplant rejection in a transplant recipient, and treating proliferative disease thalassemia and aplastic ansemia), inborn errors of metabolism, congenital immunodeficiency diseases, and myeloid dysplasia syndrome.

 This sequence represents the variable heavy (VH) chain of the humanised murine antibody HuMC3 VH. The MC3 VH sequence was humanised using the burined residue modification technique, where important non-human framework residues are unaffected. The MC3 antibody binds to the BA46 antigen of the human milk fat globule (HMFG). The milk fat globule membrane is derived from the apical surface of the mammalian epithelial cell during lactation, and therefore is a source for breast membrane glycoproteins. The antibody can be used in an in vitro method to detect a HWFG antigen for antigen fragment), and to diagnose the presence of the antigen in a subject. The antibody containing a HWFG antigen. The antibody can also be used to deliver an agent to a target (within a subject sold), containing a HWFG antigen. The antibodies can also be used for diagnosis, prognosis, and therapeutic applications of breast cancer. As the humanised antibodies retain their high affinity binding to the antigen, they are useful for immunodiagnostic and immunotherapeutic applications in humans.

 This sequence is that of the heavy chain variable domain of a chimeric antibody to an epitope of human tumour necrosis factor. It is also known as hymri. Mouse CDRs were used at positions 26-35 (CDR1), 50-65 (CDR2), and 95-102 (CDR3). In addition mouse residues were used in the frameworks at postions 48, 67, 69, 71, 73, 76, 89, 91, 94 and 108. Comparison of the HTNI mouse and BU human heavy chain residues reveals that these are identical at positions 23, 24, 29, and 78. (Updated on 25-MAR-2003 to correct PN field.)

BLICE LECTER LEC

Misc-difference

The present amino acid sequence is the humanised version of the mouse AF2 immunoglobulin, HuZAF heavy chain variable region (HuZAF-VH), of IgG1 isotype. The humanised HuZAF antibody comprises mouse AF2 antibody complementarity determining regions (CDR8), functionally joined to the human acceptor antibody EU framework regions (FR). Mature HuZAF-VH FR at positions il. 27, 28, 30, 38, 48, 67, 68, 70, 72, 74, 93, 95, 98, 107, 108, 109 and ill are occupied by residues present in the equivalent positions of the mouse mature AF2 heavy chain variable region (VH). HuZAF antibody specifically binds to and neutralises gamma-interferon (FR). They can also block the binding of mouse AF2 immunoglobulin to gamma-IFN. HuZAF does not contain sequences that are immunoglobulin to create its activity or circulating half-life. HuZAF may be administered to treat autoimmune diseases such as graft versus host disease following organ transplant, Type I diabetes, multiple sclerosis, rheumatoid arthitis, psoriasis, systemic lupus erythematosis, rheumatoid arthitis, psimary biliary cirrhosis and inflammatory bowel disease /note= "Corresponds to position 98 of mature HuZAF-VH, substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" 118..125 /label= CDR /note= "Corresponds to position 109 of mature HuZAF-VH, substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" /note= "Corresponds to position 107 of mature HuZAF-VH, substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" /note= "Corresponds to position 111 of mature HuZAF-VH, substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" /note= "Corresponds to position 95 of mature HuZAF-VH, substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" /note= "Corresponds to position 108 of mature HuzAF-VH, substituted with residue at equivalent position of mouse mature AF2 antibody heavy chain (VH)" 'note= "Corresponds to position 93 of mature HuZAF-VH Humanized murine AF2 immunoglobulins, useful for inhibiting gamma-interferon for the treatment of autoimmune diseases, ( note= "Complementarity determining region" Queen CL; Vasquez M, Landolfi NF, Tsurushita N, multiple sclerosis and diabetes Claim 10; Fig 2B; 32pp; English.  This invention describes a novel humanized anti-Pas antibody-like molecule (1) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell swiface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-andiabetic, anti-lalergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosupressive, thyronimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiarterioscleroric, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (1) are used to treat and/or prevent diseases associated with the Pas/Fas ligand system, especially systemic lugus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic

 disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, alleayy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulomephitis, hepatitis (fulminant, chromic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human auti-murine antibody response. This sequence represents a humanised anti-Fas antibody heavy chain construct designated Heu 3 which is described in the method of the invention.

The sequences given in AAR29016-17 are portions of monoclonal antibodies which were encoded by plasmids contained within the mouse hybridoma, AUK12-20. The DNA encoding the complementarity determining regions (CDR's) was isolated by polymerase chain reaction. These antibodies recognise human interleukin-6 receptor (IL-6R). The hybridoma cells were transformed with plasmids containing fragments of the antibody gene which caused the production of the antibody from the hybridoma
 The anti-human HM1,24 antibody is the preferred cytotoxic antibody to be used in the treatment of lymphocytic tumours, including T-cell tumours and B-cell tumours other than myeloma. The antibody is preferably monoclonal and has ADCC or CDC type cytotoxicity. It may be chimeric or
